**ARGUMENT IN RESPONSE TO EXAMINER'S GROUNDS OF REJECTION  
AND RESPONSE TO ARGUMENTS SECTIONS**

***The recitations of U.S. Patent Application Publication No. 2005/0079864 to Johnson, et al. (Johnson) do not render the invention of claims 1-5, 9-12, 14, 15, 25-29, 33, 34 and 39-41 unpatentable.***

Independent claims 1, 12 and 25 recite the limitation that a registration sequence is initiated in response to detecting a first signal from the egress portal or an electronic device located in proximity with the egress portal in which the first signal is associated with indicating passage through the egress portal. The claims also recite the limitation that a registration sequence with a second wireless system is initiated in response to the detection of the first signal. Johnson simply does not describe such features.

Concerning Johnson, the Examiner notes that the public network pages MS2 as part of the phantom call procedure, which is performed when the handover agent determines that MS2 is moving out of the coverage of the private network (i.e., WLAN) (see paragraph 0019 of Johnson and page 18 of the Examiner's Answer). The Examiner also concludes that "[s]ince the system switches from the public network to the private network, a signal must be detected from the egress portal/base station in order to follow the registration procedure." (see page 18 of the Examiner's Answer).

Application No. 10/649,756  
Reply Brief dated July 18, 2006

CE10823N

Applicants respectfully disagree that this description in Johnson reads on the above claim limitation. In particular, in Johnson, the handover agent determines when mobile units are close to exiting the coverage of the private network by focusing on "diminishing network signals or increasing macro network signals," which are measured at the mobile unit, not the base stations (see paragraph 0019). Thus, no first signal associated with movement through an egress portal is detected from an egress portal, as in the present claim. Moreover, the registration procedure with the public network in Johnson is initiated when the MS2 is first switched on in the private network and has nothing to do with detecting passage through an egress portal (see paragraph 0019). In other words, the mobile unit in Johnson is registered with the public macro network long before the mobile unit reaches a gateway cell.

Independent claim 39 recites that the movement of the mobile device from a coverage area of the first network to a coverage area of the second network is detected by the egress portal. In contrast, movement of the mobile unit from the private cell to the gateway cell in Johnson is detected by the handover agent, which strictly relies on changes in signal strength to do so (see paragraph 0019). The claimed invention is far more flexible because the egress portal, as a result of its ability to be strategically positioned near an exit, can facilitate the use of a triggering event to cause the mobile unit to begin searching for the first signal from the egress

Application No. 10/649,756  
Reply Brief dated July 18, 2006

CE10823N

portal as part of its registration sequence. Johnson never mentions anything about placing the handover agent near an exit or entry point.

The Examiner attempts to equate the handover agent with an egress portal by insinuating that base stations are part of the handover agent (see pages 18-19 of the Examiner's Answer). In response, Applicants note that independent claim 39 also recites that the egress portal does not include a WLAN access point. As such, the handover agent of Johnson in combination with the base stations does not read on claim 39.

***The recitations of U.S. Patent Application Publication No. 2003/0134636 to Sundar, et al. (Sundar) and U.S. Application Publication No. 2004/0137902 to Chaskar, et al. (Chaskar) do not render the invention of claims 18-24 unpatentable.***

Independent claims 18, 20 and 23 include the claim element that the egress portal resides within a cell of a WLAN and occupies a region that is smaller than the cell. These claims also recite that a signal is detected from the egress portal in response to detecting a triggering event and that the signal is associated with indicating passage through the egress portal. The Examiner correctly points out that Sundar does not teach the feature of the egress portal residing within a cell of the WLAN and occupying a region smaller than the cell (see page 13 of the Examiner's Answer) but interprets the WLAN access point of Chaskar as an egress

Application No. 10/649,756  
Reply Brief dated July 18, 2006

CE10823N

portal that occupies a region smaller than a cell (see page 19 of the Examiner's Answer).

Applicants contend, however, that it is not possible to walk or pass through a physical WLAN access point, as that term is understood by one of skill in the art. In contrast, the egress portal of the claims at issue allows for such a process to occur. Moreover, Applicants note that the act of passing through the egress portal cannot apply to the coverage area of the WLAN access point of Chaskar because the claims here expressly state that the egress portal occupies a region smaller than a WLAN cell. The coverage areas of the access points in Chaskar are indeed WLAN cells (see paragraph 0045), and one of skill in the art would understand that these coverage areas – because they are WLAN cells – do not occupy a region smaller than a WLAN cell.

Application No. 10/649,756

CE10823N

### Conclusion

Applicants contend that none of the cited prior art references describe the subject matter presented in the claims of the present invention. For the reasons set forth above, the claims on appeal present patentable subject matter such that reversal of the rejection is appropriate.

Respectfully submitted,
